# Operation Information of GC Capillary Columns

## ■ Column Installation Procedure

1. Uncoil the ends of the column long enough to reach the injector and detector.
2. Slide the nut and ferrule onto the inlet end of the column and cut 1 cm from the end of the column using a recommended cutters such as a capillary fine cutter or ceramic tube cutter. To cut a column clean and square is extremely important because cracked column walls or column blockage result in poor chromatography.
3. Refer to the GC Capillary instruction manual for the insertion length of the inlet end into the injection port.
4. Set the pressure of carrier gas and make sure that the flow rate is proper and there is no leak. Linear carrier gas velocity is approx. 30 cm/sec (He). For setting the head pressure, refer to the table below (internal injection port pressure). The column head pressure differs depending on the type of GC and carrier gas.

Relationship Between Column and Head Pressure

Length / I.D.	0.18 mm I.D.	0.25 mm I.D.	0.32 mm I.D.	0.53 mm I.D.
20 m	150 kPa (1.5 bar, 21.8 psi)	–	–	–
30 m	–	100 kPa (1.0 bar, 14.5 psi)	70 kPa (0.7 bar, 10.2 psi)	20 kPa (0.2 bar, 2.9 psi)
60 m	–	200 kPa (2.0 bar, 29.0 psi)	140 kPa (1.4 bar, 20.3 psi)	50 kPa (0.5 bar, 7.2 psi)

5. The installation procedure of the outlet end is the same as for the inlet end. Slide the nut and ferrule onto the outlet end of the column and cut 1 cm from the end of column using a cutter. Connect the end as described in instruction manual. When conditioning the column, disconnect the outlet end from the detector to prevent contamination.

To check for gas leaks, use the leak detector LD239 (Cat. No. 2702-19340). Do not use soap solution such as snoop for high sensitivity analysis as it may cause contamination of the entire system.

## ■ Column Conditioning

1. Verify the carrier gas is at the rate you intend. Replace the gas purification tube (moisture, oxygen and for organic matter removal) as necessary.
2. Don't connect the capillary column to the detector.
3. Purge the column with carrier gas for more than 20 minutes at room temperature and set a temperature programing rate of 5 to 10 °C/minute varying with stationary phase described below. Be aware that it may result in unwilling performance if the column is heated with insufficient purge.
4. Program the oven either to 10 °C higher than the final temperature required in the analysis or to the isothermal Max. Temperature whichever is lower. After the oven temperature reaches the final set point, hold this temperature for 1 to 2 hours varying with stationary phase described below.

### On Silicone Stationary Phase

Temperature programing rate: 10 °C/minute

Holding Time at the Final Temperature: 2 hours

### On Wax Stationary Phase

Temperature programing rate: 5 °C/minute

Holding Time at 100 °C 30 minutes (For dehydration)

Holding Time at the Final Temperature: 2 hours

5. After the conditioning completed, connect the column to the detector. After resetting to the analysis initial temperature, the baseline gradually decreases for approx. 10 minutes. Then the baseline stabilizes, and the analysis can be started.

## ■ Features

### High Inertness

Inertness is one of the most difficult attributes to achieve in an analytical column. GL Sciences' proprietary inert processing technology completely eliminates residues of metal, halide and silanol which are in the column's inner surface. It is possible to obtain excellent symmetry peaks for polar, basic, acidic compounds and metal ligands.

### Ultra-Low Bleed

In GC/MS analysis, it is important to select a low bleed column that has little baseline rise to improve the S/N ratio and detection limit, also to prevent contamination in the MS detector.

The increased baseline is caused when the siloxane (Si-O) liquid phase is decomposed by high temperature into cyclic siloxane; which can be seen in the MS spectrum as *m/z* 207.

Based on superior technologies for cross-linking of stationary phases and surface deactivation of fused silica InertCap columns for GC/MS analysis offers technologies, with ultra-low bleed.

## ■ Quality Assurance

InertCap Capillary columns are manufactured and shipped under strict quality control at the GL Science factory, Japan, in accordance with ISO9001 quality certification. InertCap is tested by standard samples which includes high adsorption compounds.

### Inspection Report

To achieve the highest quality assurance standards, all columns are tested for quality. The inspection report includes theoretical plate number (N) and coating efficiency (CE), to ensure optimal separation and stable quality.

Also, to guarantee the specific performance of some products, a test chromatogram reporting the separation and adsorption of related standard components is included.

## ■ InertCap ProGuard - Build-in Guard Column

Guard columns and retention gaps are used widely in gas chromatography. Both are short (1-10 m) piece of uncoated deactivated fused silica tubing which are placed in-line between the GC injection port and the analytical capillary column. Guard column is to protect the analytical column from contamination, not allowing nonvolatile materials to reach the analytical column. Retention gap is to help focus the compounds in large volume injected from the inlet to a small band at the head of the analytical column. InertCap ProGuard is a “guard column built-in” analytical capillary column without the connection for such purposes. For this reason, now there is no need to worry about leakage and compounds adsorption.

## ■ InertCap T.L. - Built-in Transfer Line

Transfer lines are widely used for connecting interface of GC chromatography and MS. InertCap T.L. is a “transfer line built-in” analytical capillary column without connectors. Transfer line prevents degradation of stationary phase and keeps it low bleed. Additionally, transfer line is inert to transfer samples with no adsorption. Therefore there is no need to worry about leakage and compound adsorption.

- Equivalents : DB-5ms, Rxi-5Sil MS, VF-5ms, SLB-5, BPX-5

### Structure

InertCap 5MS/Sil is a low polar column bonded 5 % diphenyl (equiv.) – 95 % dimethylpolysilphenylene siloxane. Designed for GC/MS, InertCap 5MS/Sil achieves the higher heat resistance and lower bleeding by arylene technology. In addition to our basic performance and quality inspection, pesticide mixture sample is analyzed for the further rigorous inspection for each lot to guarantee the product reliability.

### Structure

InertCap 5MS/NP is a low polar column bonded 5 % diphenyl – 95 % dimethylpolysiloxane. Designed as a column for GC/MS, InertCap 5MS/NP achieves the world highest inertness and lowest bleeding.

- USP Phase G43
- Medium Polarity
- Cross-Linked

- Equivalents: DB-1301, HP-1301, Rtx-1301, VF-1301ms

InertCap 1301 is a medium polar column bonded 6 % cyanopropylphenyl and 94 % dimethylpolysiloxane. Compared to InertCap 25, polarity of InertCap 1301 is slightly lower. Cyano groups contained in the stationary phase offer unique selectivities.

- Equivalent to USP Phase G42
- Medium Polarity
- Cross-Linked
- Suitable for pesticides and polyaromatic analysis
- Equivalents : DB-35ms UI, VF-35ms, Rxi-35sil MS

### Structure

InertCap 35 is a medium polar column bonded 35 % diphenyl - 65 % dimethylpolysiloxane. With a stronger polarity than InertCap 25, InertCap 35 also shows high separation efficiency for the analyses of semi volatile compounds and solvents. By increasing the heat resistance of the liquid phase, the maximum operating temperature of 360 °C can be achieved. Also designed for GC/MS analysis, the best in the world Achieves class inactivity and low bleed.

- USP Phase G46
- Medium Polarity
- Cross-Linked
- Suitable for pesticides, sugars, TMS derivatives, drugs and steroids
- Equivalent : VF-1701ms

### Structure

InertCap 1701MS is a medium polar column incorporating 14 % cyanopropylphenyl and 86 % dimethylpolysiloxane, designed for GC/MS. Containing cyano groups as InertCap 1301, InertCap 1701MS has a stronger polarity than InertCap 25. It is suitable for pesticides screening analyses.

- USP Phase G3
- Medium Polarity
- Cross-Linked
- Ultra Low Bleed
- Equivalents: DB-17ms, Rxi-17, VF-17ms, SPB-17

### Structure

InertCap 17MS is a medium polar column bonded 50 % diphenyl - 50 % dimethylpolysiloxane, designed for GC/MS.

InertCap 17MS achieves one of the world highest inertness and lowest bleed, and is suitable for microanalyses such as pesticides analyses.

- Excellent Separation for Organophosphorous Pesticides
- Equivalents: DB-210, Rtx-200, VF-200ms

### Structure

InertCap 210 is a medium polar column bonded 50 % trifluoropropyl and 50 % methylpolysiloxane. With a unique selectivity against polar compounds, InertCap 210 is suitable for analyses of such compounds containing phosphorous-nitrogen.

### Structure

InertCap 225 is a medium polar column bonded 50 % cyanopropylmethyl and 50 % phenylmethylpolysiloxane. Cyano group in the stationary phase includes triple bond and retains compounds stronger in accordance with the increase of the number of unsaturated bond by their dipole/dipole interactions. For that reasons InertCap 225 shows high separation efficiency for analyses of geometrical isomers.

- Polyethylene Glycol (PEG)
- USP Phase G16
- High Polarity
- Cross-Linked
- Equivalents: DB-WAX, HP-INNOWax, Rtx-Wax, Stabilwax

InertCap Pure-WAX is a high polar column bonded polyethylene glycol. Based on newly developed inner treatment technology, InertCap Pure-WAX achieves the highest inertness among the market available columns. InertCap Pure-WAX is an optimal column for analyses of acidic compounds and basic compounds that commercially available WAX columns were not capable of analyzing.

- Equivalents: DB-WAXetr, SolGel-WAX

### Structure

InertCap WAX-HT is a strong polar column bonded polyethylene glycol. By increasing the heat resistance of stationary phase, InertCap WAX-HT achieves the practical use of the maximum temperature 280 °C. Being optimal for the analyses of polar samples such as solvents, InertCap WAX-HT also available for the analyses of high-boiling compounds.

## InertCap AQUATIC

- 25 % Diphenyl – 75 % Dimethylpolysiloxane
- USP Phase G28
- Medium Polarity
- Cross-Linked
- No Equivalent

### Structure

AQUATIC is a medium polar column bonded 25 % diphenyl – 75 % dimethylpolysiloxane, especially designed for the analyses of volatile organic compounds in water.

As the column polarity is optimized, AQUATIC enables high separations. Column performance report with analysis of 33 compounds is attached to every column which guarantee its significant separation efficiency and reproducibility. AQUATIC is suitable for VOCs simultaneous analyses by purge and trap.

# InertCap for Amines

## ■ InertCap for Amines

- Cross-Linked
- Optimized Performance for Analysis of Amines from C2 to C10
- Ideal for the simultaneous analyses of mixed sample such as alcohol etc.
- No Equivalent

InertCap for Amines shows excellent inertness and separation performances for analysis of amines from C2 to C10. Basic compounds can be perfectly eluted without adsorption from the column. Unlike other manufacturer's columns, InertCap for Amines can simultaneously analyze the other polar compounds such as alcohols due to our state-of-art inner column deactivation treatment techniques.

## InertCap CHIRAMIX

- Designed for excellent performance in separating enantiomers
- 2 or more cyclodextrin derivatives are used in the liquid phase
- Separating the targeted sample with a sharp peak
- GL Sciences' original, No equivalent

When analyzing enantiomers, it is basic to use several types of columns depending on the sample matrix. InertCap CHIRAMIX has an Optimized performance for separation of enantiomers coated with a mixture of cyclodextrin derivatives. Compared to the other commercially available columns which are coated with single cyclodextrin, InertCap CHIRAMIX can effectively separates a variety of enantiomers in a short time as the 1st choice column. To expedite the analysis, it is important to divide the enantiomers as much as possible in the first analytical column. InertCap CHIRAMIX can divide a wide range of enantiomers and is the best "first choice" column.

Note) InertCap CHIRAMIX was jointly developed with T. HASEGAWA CO., LTD.  
 Note) CHIRAMIX is a brand name of T. HASEGAWA CO., LTD.

## ■ Fused Silica Capillary Tubing

### Guard Columns

Injecting samples with contaminants or nonvolatile compounds to a column causes active sites and/or degradation of the stationary phase. With the use of on-column and splitless injections, and even with split injection, contamination and degradation of the columns are unavoidable problem.

To protect a analytical column from such damages, it is effective to connect a 2 m fused silica deactivated capillary tubing to the inlet of the column and replace the tubing as the contaminants gets accumulated.

### Retention Gap Columns

Retention gap is to help focus the compounds in large volume injected from the inlet to a tight band at the head of the analytical column in order to reduce peak broadening.

### Transfer Line

A transfer line can be used for GC/MS, LC/MS, GC/FTIR, LC/GC, Multi-Dimensional GC, or sniffer adaptors.

## ■ Applications

### Visit our website

We provide with technical support on our website. You can browse through or search GL Sciences' online library of LC applications, featuring chromatograms with method, conditions, sorted by technique and compound class by InertSearch and Technical Note.

<https://www.glsciences.com/>

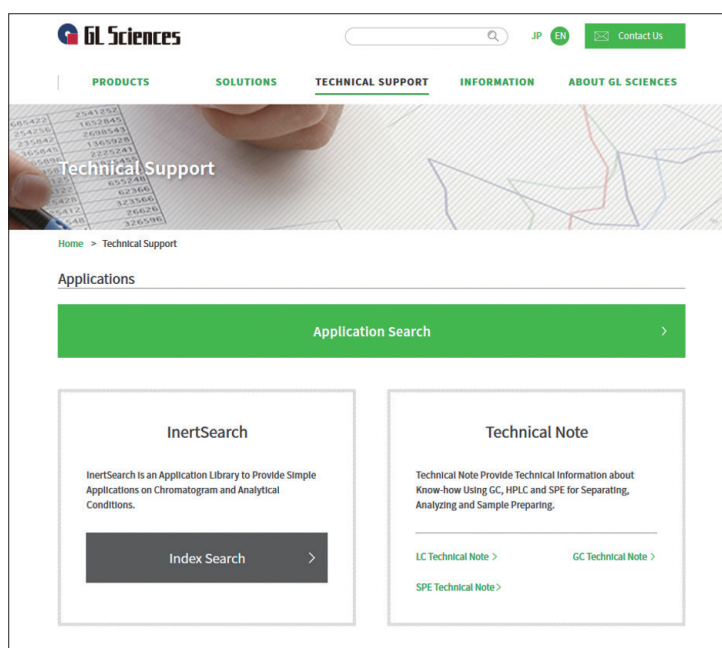

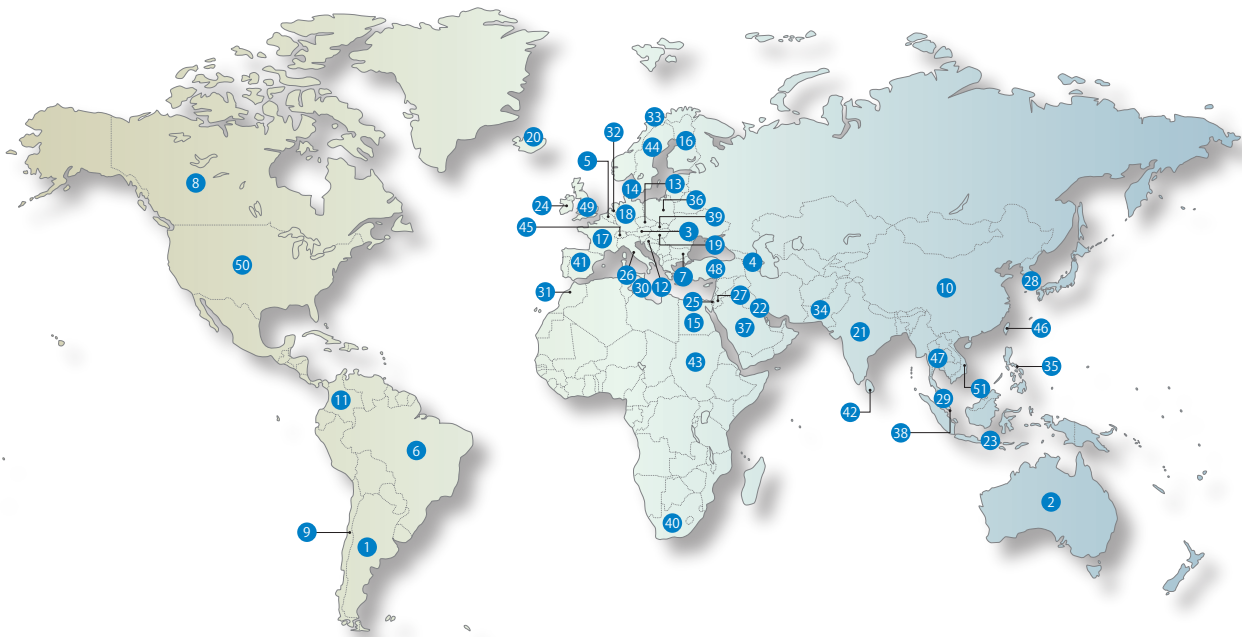

### InertSearch [https://www.glsciences.com/technique/app/inert\\_search.html](https://www.glsciences.com/technique/app/inert_search.html)

"InertSearch" is GL Sciences' onsite search engine for chromatographic data. A large number of chromatographic results of various analyses are available.

### Technical Note <https://www.glsciences.com/technique/index.html>

"Technical Note" is a database of chromatographic results and useful information of various analyses. These files provide detailed explanation of each analysis which will help you greatly (e.g. method and instruction, chromatogram with analytic condition, chemical structure of compounds).
