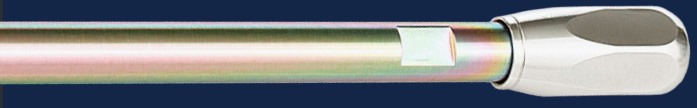
HALO®

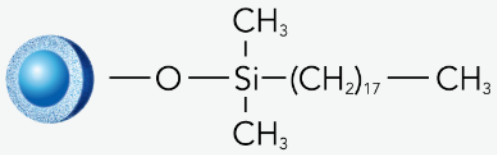
OLIGO C18

Bringing the speed and efficiency of Fused-Core® performance to oligonucleotide separations.

A BETTER PATH TO SEPARATIONS



HALO® OLIGO C18



Built upon proven Fused-Core® particle technology for speed and efficiency, the HALO® OLIGO C18 incorporates surface modified organo-silane technology for alkaline resistance resulting in excellent stability under elevated pH operating conditions common in oligonucleotide separation methods.

Loaded into surface passivated column hardware to address adsorption concerns, the HALO® OLIGO columns are ready for use with standard or bio inert instrumentation.

FEATURES OF HALO® OLIGO C18

- 120 Å pore size, enables separations of oligomers up to 60 bases in length
- High pH and temperature stability, designed for conditions suited for oligonucleotide separations
- UHPLC and mass spectrometry compatible stationary phase
- Surface passivated column hardware to reduce potential of stainless steel sample adsorption.

EXCELLENT LOT-TO-LOT REPRODUCIBILITY

Four different lots of HALO® OLIGO C18 were tested using a ladder of single stranded DNA ranging in base length from 10 mer to 60 mer.

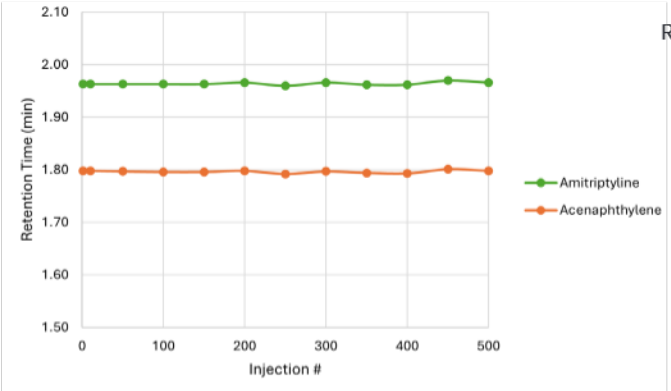
PERFORMANCE YOU CAN RELY ON!

Testing the packing material stability that is used in the HALO® OLIGO C18 column, a less than 1% change in retention is achieved over 20,000 column volumes. This stability run was performed at both high pH (10) and high T (60 °C).



RSD <1% for both analytes

APPLICATIONS

COMPETITIVE ADVANTAGE OF HALO® OLIGO

An oligonucleotide ladder of mixed sequence and length is separated on the HALO® OLIGO C18 and a competitor oligonucleotide column under high pH conditions. The oligomers of 20 base length AND higher begin to tail significantly on the competitor column. The same oligomers show no tailing on the HALO® column demonstrating the chromatographic efficiency and speed of Fused-Core®. Note: Tailing of the competitor column could represent poor column loading, however, both the HALO® and competitor columns were QC tested and passed prior to analysis.

OLIGONUCLEOTIDE SEPARATION WITH LC/MS DETECTION CONDITIONS

Resolution of intermediate length synthetic oligonucleotides and impurities, can be conducted using shallow gradients of methanol in MS compatible IP-RP conditions. This example shows synthetic oligonucleotides of 15-21 bases resolved using 5 mM TEA as the IP reagent, with 50 mM HFIP buffer additive (left side, Abs 260 nm). In series, online ESI-MS analysis was obtained (right side), showing the charge states for the 6122 amu MW T7 promoter synthetic oligonucleotide primer. Retention of this ssDNA is determined by length and sequence (composition), which permits closely related impurities and failure sequences (n-1) to be well resolved using the HALO OLIGO C18 column.

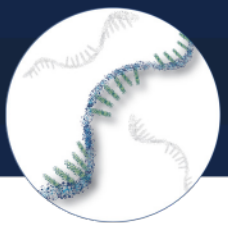
APPLICATIONS



OLIGONUCLEOTIDE PERFORMANCE MIX

By using the HALO® OLIGO C18 column under high pH conditions a sample of 6 different oligonucleotides can be separated in under 4.5 minutes. Using the SigmaAldrich Oligonucleotide Performance Standard Mix, the HALO® OLIGO C18 demonstrates utility as part of system suitability testing. The standard, with a range of 12 to 33 oligomers in base length, and having two 12 base length oligos, serves as an ideal performance mix.

RAPID SEPARATION OF OLIGONUCLEOTIDE LADDER

This example demonstrates the resolution of an Oligonucleotide Standard mixture (10- to 60-mer ssDNA) using triethylammonium acetate (TEAA) with absorbance detection and gradient elution with acetonitrile. This fast separation (less than 3.5 minutes) illustrates the excellent peak shape, and high resolution of oligonucleotides of up to 60 oligonucleotides in length using Advanced Material Technology's Fused-Core® technology in the 2.1 x 50 mm HALO® OLIGO C18 column.
